

SALONSYNC PROJECT PROPOSAL

Serverless Salon Management Ecosystem

PROJECT DESCRIPTION

SalonSync is a professional-grade, serverless management platform specifically designed for medium-sized salons that currently rely on manual phone calls and paper-based scheduling. The project aims to solve the "Double-Booking Dilemma" by synchronizing real-time customer web bookings with an easy-to-use digital dashboard for salon staff. By utilizing a **Zero-Setup Cost** model, the project removes the financial barrier for local business owners, providing them with a 14-day free trial followed by a low-cost monthly subscription of **2,500 LKR**.

The system is built to be "SaaS-Ready," meaning while the first stage focuses on perfecting the experience for a single salon, the underlying architecture is designed to scale effortlessly to hundreds of locations. It transforms the salon's workflow by automating reminders, organizing staff schedules, and providing a professional digital storefront that captures bookings 24/7 without requiring a receptionist to answer the phone.

MAIN FEATURES

1. Smart "Cutter" Slot System

A dynamic scheduling engine managing availability for up to 3 stylists simultaneously, preventing overlapping bookings.

2. Unified Admin Dashboard

A simplified, mobile-responsive control center for staff to view daily grids, add manual entries, and manage leave.

3. Customer Booking Portal

A sleek, mobile-first web app for clients to choose stylists, select time slots, and receive instant confirmations.

4. Automated Communication

Integration with SMS gateways (Notify.Ik / ShoutOUT) and WhatsApp for automated appointment reminders.

5. QR Code Marketing

Custom QR codes for salon desks, enabling physical customers to scan and book digitally, building a client database.

6. Secure Email Authentication

A professional login system using AWS Cognito with secure "Forgot Password" and email verification features.

TECHNICAL STACK (PHASE 1)

The project follows a **Serverless AWS Stack** to ensure 99.9% uptime with minimal maintenance costs:

Category	Technology
Development Environment	Google Antigravity (Agentic IDE)
Frontend Framework	React.js + Tailwind CSS
Backend Runtime	Node.js on AWS Lambda
Database	AWS DynamoDB (NoSQL - Single Table Design)
Identity & Auth	AWS Cognito
API Management	Amazon API Gateway
Asset Storage	AWS S3
